AB - J70026750 The condensates useful as adhesives, plasticisers and synth.  
resin additives are prepd. by heating the acid (I) or a mixt. with a  
higher aliphatic acid, resin acid etc. with a small amt. of boric  
acid. (I) is obtained by solvent extraction of cashew nut shells.  
The condensation reaction is pref. effected at 100-140 degrees C. In  
an example 5g boric acid and 300g anacardic acid were heated at  
130-140 degrees C. A hard glutinous condensate having a mol. wt. of  
is approx. 3500 being obtained.
